Call Centre Performance Report

The dashboard provides a comprehensive analysis of call center operations over the selected period (January - March 2021).

A total of 5,000 calls were recorded and handled by 8 agents. Out of these, 81% of calls were answered, indicating a strong responsiveness level. However, 19% of calls were unanswered, highlighting a gap that may require improved staffing or call handling strategies.

The resolution rate stands at 73%, suggesting that while most customer issues are resolved, there is still room for improvement in achieving higher resolution.

Customer satisfaction is recorded at 69% (average of 3/5 of satisfaction rating), indicating moderate service quality. This suggests that while service delivery is acceptable, there is a need to enhance customer experience to achieve higher satisfaction levels.

The average speed of answer is 68 seconds, which is slightly above the target benchmark of 60 seconds. This indicates potential delays in response time that could impact customer satisfaction.

Call Trend Analysis
The call trend shows fluctuations in daily call volumes, generally hovering around the average level, with noticeable spikes in early periods and a sharp decline toward the end of the timeline. This suggests variability in demand, with possible external factors influencing call volume.

Unanswered Call Trend
The unanswered call trend remains relatively low compared to total calls, but shows consistent occurrences across the period. While not critically high, the persistence of unanswered calls indicates systemic inefficiencies that should be addressed to improve service levels.

Topic Analysis
The majority of customer interactions are concentrated around Streaming, Technical Support, and Payment-related issues, each contributing approximately 20% of total calls. This highlights key problem areas where improvements in service or product reliability could significantly reduce call volume.

Agent Performance
Agent performance is relatively consistent across the team, with resolution rates and satisfaction levels closely aligned. However, slight variations suggest opportunities for targeted training to improve individual performance and overall efficiency.
